

Hand pump

Specifications

- Two-speed pump for quick filling
- Working volume: 327 cm³
- Service pressure factory set to 100, 200 or 400 bars depending on the product being used

Pump used to supply the hydraulic bars for group 010 and the cartridges for group 030.

The pump is factory set to the service pressure and delivered with the required hoses.

The standard delivery includes a main 3000 mm hose + 2 or 3 800 mm hoses for the bars, as well as all the required connectors.

In extreme applications, the pump can be used for releasing mechanical clamps type BTM (040-01) and BCM (060-01) or for heavy duty bars LGGH (020-01). However, due to the physical effort involved, we recommend using an air hydraulic pump (see 110-02).

Options

- Quick connector using a leak-free ball coupler.
- Pressure gauge.
- Pressure switch to prevent the press from being started when the bars are raised.
- High capacity pump to connect a higher number of bars.
